- (b) a computer having an operating system, coupled to said stimuli input means, for processing said at least one stimulus to produce a function control signal to control the operation of said computer <u>and wherein said computer does not require an articulated response from the user</u>, said computer comprising:
- (1) function selection means for receiving said at least one stimulus and wherein said function selection means comprises a memory including a correspondence between a plurality of previously-stored user [said at least one stimulus] <u>stimuli</u> and a plurality of desired function control signals;
- (2) identification means, coupled to said function selection means, for comparing said at least one stimulus to said correspondence to identify a function control signal corresponding to said at least one stimulus, said function control signal being transmitted to the operating system of said computer.

Please amend Claim 55 as follows:

- 55. (Twice Amended) Apparatus for controlling computer operation from one or more stimuli sensed from one or more thoughts in a user's body, said apparatus comprising:
- (a) detecting means for detecting said one or more stimuli sensed from said one or more thoughts to produce one or more detected stimuli,
- (b) selecting means for receiving one or more of said detected stimuli to perform a function and selecting a correspondence to one or more user thoughts to produce a selected function and wherein said selecting means does not require an articulated response from the user.
